Viral coa HIV virus HIV virus

```
This sequence represents a human immunodeficiency virus type 1 (HIV-1) envelope (env) protein amino acid sequence. The invention relates to the HIV-1 env protein or its fragments, which when administered to a mammal, induces the production of broadly cross-reactive neutralising anti-serum against multiple strains of HIV-1. The HIV-1 env protein and its fragments are useful as vaccines, immunogenic compositions or disagnostic reagents. They can also be used to detect anti-HIV-1/HIV-1 neutralizing antibodies in a sample. The amino acid sequence and its fragments or mRNA sequence are useful for generating antibodies in a mammal, In addition, a recombinant delivery vector containing the env amino acid sequence may also be used as a vaccine. (Updated on 12-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human immunodeficiency virus-1 envelope protein, useful as a vaccine or immunogenic preparation against HIV-1 infection induces the production of broadly cross-reactive neutralizing anti-serum.
                                                                                                                                                                                                                                                                                                                    HIV-1; envelope protein; env; cross reactive anti-serum; antibody; vaccine; antibody; detect.

Novel genomic nucleic acids of non-subtype B human immunodeficiency virus type 1 useful for detecting and treating AIDS comprises a specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present in invention provides the protein and coding sequences for a number of human immunodeficiency virus (HIV) type 1 non-subtype B stolates. The sequences shown include the near full-length coding sequences from each isolate, and the env, pol, vif, vpr, vpu, gag, tat, rev and nef proteins. These can be used to detect the presence of HIV-1 in a sample and to produce antibodies against non-subtype B HIV-1 virus. These antibodies can be used in vaccines to prevent and treat HIV infection. (Updated on 12-SEP-2003 to standardise OS field)

                                                                             ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents a human immunodeficiency virus type 1 (HIV-1) R2 strain envelope (env) protein V3 region peptide sequence. The invention relates to the HIV-1 env protein or its fragments, which when administered to a mammal, induces the production of broadly crossreactive neutralising anti-serum against multiple strains of HIV-1. The HIV-1 env protein and its fragments are useful as vaccines, immunogenic compositions or diagnostic reagents. They are also be used to detect anti-HIV-1/HIV-1 neutralizing antibodies in a sample. The amino acid sequence and its fragments or mRNA sequence are useful for generating antibodies in a mammal, In addition, a recombinant delivery vector containing the env amino acid sequence may also be used as a vaccine. The sequences represented in AAQ21054-61, AAQ21194-311 and AAQ21321-78 encode PNDs of HIV (envelope protein) which are useful as immunogens for AIDS vaccines, partic. in the form of conjugates. To prepare antigenic conjugates, PND (of HIV) and Omp (of Neisseria) are prepd. separately, then linked by cross-linking agents, monogeneric spacers or bigeneric spacers. The conjugate may comprise 1-50 PNDs. A PND has 15 amino acids or less, but at least 5, it contains Gly-X-Gly, where X is Pro, Leu, Ala, Gln or Ser. The conjugates as AIDS or HIV vaccines can be used prepost-exposure to prevent or treat HIV infection or disease, and are capable of producing an immune response specific for the immunogen. See also AAQ21052-61, AAQ21051-78
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequences represented in AAQ21054-61, AAQ21194-311 and AAQ21321-78 encode PNDs of HIV (envelope protein) which are useful as immunogens for AIDS vaccines, partic. in the form of conjugates.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                            The sequences represented in AAQ21054-61, AAQ21194-311 and AAQ21321-78 encode PNDs of HIV (envelope protein) which are useful as immunogens for ALBS vaccines, partic. in the form of conjugates. To prepare antigenic conjugates, PND (of HIV) and OMP (of Neisseria) are prepar separately, then linked by cross-linking agents, monogeneric spacers or bigeneric spacers. The conjugate may comprise 1-50 PNDs. A PND has 33 amino acids or less, but at least 5, it contains Gly-X-Gly, where X is Pro, Leu, Ala, Gln or Ser. The conjugates as AIDS or HIV vaccines can be used pre- or personent or treat HIV infection or disease, and are capable of producing an immune response specific for the immunogen. then linked by cross-linking agents, monogeneric spacers or bigeneric spacers. The conjugate may comprise 1-50 PNDs. A PND has 35 amino acids or less, but at least 5, it contains Gly-X-Gly, where X is Pro, Leu, Ala, Gln or Ser. The conjugates as AIDS or HIV vaccines can be used pre- or post- exposure to prevent or treat HIV infection or disease, and are capable of producing an immune response specific for the immunogen. See also AAQ21052-61, AAQ21194-311 and AAQ21321-78
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequences represented in AAQ21054-61, AAQ21194-311 and AAQ21321-78 encode PNDs of HIV (envelope protein) which are useful as immunogens for AIDS vaccines, partic. in the form of conjugates. To prepare antigenic conjugates, PND (of HIV) and OMD (of Neisseria) are prepd. separately, then linked by cross-linking agents, monogeneric spacers or bigeneric spacers. The conjugate may comprise 1:50 PNNs. A PND has 35 amino acids or less, but at least 5, it contains Gly-X-Gly, where X is Pro, Leu, Ala, Gln or Ser. The conjugates as AIDS or HIV vaccines can be used pre- or payent or prevent or treat HIV infection or disease, and are capable of producing an immune response specific for the immunogen. To prepare antigenic conjugates, PND (of HIV) and Omp (of Neisseria) are prepd. separately, then linked by cross-linking agents, monogeneric spacers or bigeneric spacers. The conjugate may comprise 1-50 PNDs. A PND has 35 amino acids or less, but at least 5, it contains Gly-X-Gly, where X is Pro, Leu, Ala, Gln or Ser. The conjugates as AIDS or HIV vaccines can be used preposer exposure to prevent or treat HIV infection or disease, and are capable of producing an immune response specific for the immunogen. See
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New antigenic conjugate of HIV major neutralisation determinant -
covalently linked to outer membrane proteosome of Neisseria, useful as
vaccine and in treating and preventing HIV infections, AIDS and ARC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

Human immunodeficiency virus

```
The sequences represented in AAQ21054-61, AAQ21194-311 and AAQ21321-78 encode PNDs of HIV (envelope protein) which are useful as immunogens for ADS vaccines, partic. in the form of conjugates. To prepare antigenic conjugates, PND (of HIV) and OMP (of Neisseria) are prepar entigenic conjugates, PND (of HIV) and OMP (of Neisseria) are prepar suringenic paperers. The conjugate may comprise 1:50 PNDs. A PND has 35 amino acids or less, but at least 5, it contains Gly-X-Gly, where X is Pro, Leu, Ala, Gln or Ser. The conjugates as AIDS or HIV vaccines can be used pre- or pacyent or treat HIV infection or disease, and are capable of producing an immune response specific for the immunogen. See also AAQ21052-61, AAQ21194-311 and AAQ21321-78
                                                                                                                                                                                                                                                                                                          New antigenic conjugate of HIV major neutralisation determinant -
covalently linked to outer membrane proteosome of Neisseria, useful as
vaccine and in treating and preventing HIV infections, AIDS and ARC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequences represented in AAQ21054-61, AAQ21194-311 and AAQ21321-78 encode PNDs of HIV (envelope protein) which are useful as immunogens for AIDS vaccines, partic. in the form of conjugates. To prepare antigenic conjugates, PND (of HIV) and Omp (of Neisseria) are prepd. separately, then linked by cross-linking agents, monogeneric spacers or bigeneric spacers. The conjugate may comprise 1-50 PNDs. A PND has 35 amino acids or less, but at least 5, it contains Gly-X-Gly, where X is Pro, Leu, Ala, Gln or Ser. The conjugates as AIDS or HIV vaccines can be used preposer exposure to prevent or treat HIV infection or disease, and are capable of producing an immune response specific for the immunogen. See
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New antigenic conjugate of HIV major neutralisation determinant -covalently linked to outer membrane proteosome of Neisseria, useful as vaccine and in treating and preventing HIV infections, AIDS and ARC.

The sequences represented in AAQ21054-61, AAQ21194-311 and AAQ21321-78 encode PNDs of HIV (envelope protein) which are useful as immunogens for ALDS vaccines, partic. in the form of conjugates. To prepare antigenic conjugates, PND (of HIV) and Omp (of Neisseria) are prepd. separately, then linked by cross-linking agents, monogeneric spacers or bigeneric spacers. The conjugate may comprise 1-50 PNDs. A PND has 35 amino acids or less, but at least 5, it contains Gly-X-Gly, where X is Pro, leu, Ala, Gln or Ser. The conjugates as AIDS or HIV vaccines can be used pre- or post- exposure to prevent or treat HIV infection or disease, and are capable of producing an immune response specific for the immunogen. See also AAQ21052-61, AAQ21194-311 and AAQ21321-78
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The sequences represented in AAQ21054-61, AAQ21194-311 and AAQ21321-78 encode PNDs of HIV (envelope protein) which are useful as immunogens for AIDS vaccines, partic. in the form of conjugates. To prepare antigenic
                                                  New antigenic conjugate of HIV major neutralisation determinant - covalently linked to outer membrane proteosome of Neisseria, useful vaccine and in treating and preventing HIV infections, AIDS and ARC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antigenic conjugate of HIV major neutralisation determinant - covalently linked to outer membrane proteosome of Neisseria, useful vaccine and in treating and preventing HIV infections, AIDS and ARC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   HIV; PND; principal neutralising determinant; Omp; Neisseria; outer membrane proteosome; AIDS; vaccine; envelope gene.

The amplified fragments were fused to beta-galactosidase coding sequence. E.coli transformants were cultured to produce the fusion protein. The expressed PND proteins were divided into groups based on their reactivity with neutralising antibodies and their amino acid sequence. The amino acid sequence was analysed using Robson's analytical program for protein secondary structure. Five groups were identified and 90% of all previously reported PND peptides were included in 3 main groups (i.e.
conjugates, PND (of HIV) and Omp (of Neisseria) are prepd. separately, then linked by cross-linking agents, monogeneric spacers or bigeneric spacers. The conjugate may comprise 1-50 PNDs. A PND has 35 amino acids or less, but at least 5, it contains Gly-X-Gly, where X is Pro, Leu, Ala, Gln or Ser. The conjugates as ALDS or HIV vaccines can be used pre- or pacyene to prevent or treat HIV infection or disease, and are capable of producing an immune response specific for the immunogen. The invention may be useful for the production of compounds with an anti-HIV activity or for production of a vaccine. The polypeptide, a polyvalent immunogen, is useful in preparing a composition for inducing the production of neutralising antibodies against HIV. The present sequence is that of a peptide which is related to the peptide of the invention.
Groups I, II and III). Group II PND peptides are those which have the structure XXBBBBX on the amino-terminal side of the GPGR motif (B = betastrand structure and X = turn or coil structure). Vaccine preparations comprising representative peptides from each of the 5 groups can be used to develop vaccines able to recognise any HIV variant. See AAQ31607-Q31608, AARR8995-R29000 and AAR29110-R29128. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New protein comprising the V3 sequence of 62.19 in the context of Con6 gpl20, useful in preparing a composition for inducing the production of neutralizing antibodies against HIV.
                                                                                                                                                                                                                       Gaps

The biotin-labelled peptide was demonstrated to bind to the cell surface P95 protein on human CD4 - CEM T-cells. The invention relates to a newly identified V3 loop HIV receptor. This novel protein complex receptor for HIV retroviruses consists of an association of 3 proteins, named p95/mucleolin, P40/PHMPI and P30/PHMPI (see AAM84052-54), that are implicated as ocfactors in the process of HIV entry into cells. The receptor proteins can be isolated from human CD4 + CEM T-cell extracts using an affinity matrix containing either the pseudopeptide (KpsiHT2)NPR) template assembled synthetic peptide or the synthetic V3 loop peptide (see AAW84055). The invention provides products and compositions for the treatment, diagnosis and prevention of HIV infection. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated V3 loop HIV receptor - comprises P95/nucleolin, P40/PHAPII and P30/PHAPI proteins, used to develop products for the treatment and prevention of HIV infection.

Human immunodeficiency virus-1 envelope protein, useful as a vaccine or immunogenic preparation against HIV-1 infection induces the production of broadly cross-reactive neutralizing anti-serum.

Claim 2; Page 33; 54pp; English.

This sequence represents a human immunodeficiency virus type 1 (HIV-1) envelope (env) protein amino acid sequence. The invention relates to the HIV-1 env protein or its fragments, which when administered to a mammal, induces the production of broadly cross-reactive neutralising anti-serum against multiple strains of HIV-1. The HIV-1 env protein and its fragments are useful as vaccines, immunogenic compositions or diagnostic reagents. They can also be used to detect anti-HIV-1/HIV-1 neutralizing antibodies in a sample. The amino acid sequence and its fragments or mRNA sequence are useful for generating antibodies in a mammal, In addition, a recombinant delivery vector containing the env amino acid sequence may also be used as a vaccine. (Updated on 12-SEP-2003 to standardise OS

```
US HIV-1 isolates MN-ST1 and BA-L, ENV protein and DNA - are useful in therapeutics, vaccines and diagnostic tests.
                                                                                           human immunodeficiency virus; United States; MN isolate; AIDS

The infectious molecular clone, lambda MN-ST1, was obtained by cloning integrated provirus from DNA purified from peripheral blood lymphocytes integrated with HIV-1(NN) and maintained in culture for one month. The integrated proviral DNA was partially digested with Sau3A to give fragments of 15-20 kb. The fragments were cloned in EMBL3 and the entire sequence of the clone was determined and the amino acid sequence of the env protein was deduced from it. (Note: Revised entry submitted to correct the parent number format of US Government-owned NTIS applications to prevent clashes with ongoing US granted patent numbers. For further www.derwent.com/dwpi/updates/ntis us.html.) (Updated on 25-MAR-2003 to correct PR field.) (Updated on 27-AUG-2003 to correct OS field.)

                                                                                                     The infectious molecular clone, lambda MN-ST1, was obtained by cloning integrated provirus from DNA purified from peripheral blood lymphocytes infected with HIV-1 (MN) and maintained in culture for one month. The integrated proviral DNA was partially digested with Sau3A to produce fragments of 15-20 kb. The fragments were cloned into the BamHI site of andbad EmBL3. The DNA sequence of the entire clone was determined and the env gene was excised and cloned into an expression plasmid for recombinant production of the envelope protein. The env protein has the against HIV. (Updated on 25-MAR-2003 to correct PF field.) (Updated on 17-0CT-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents the predicted amino acid sequence of the MN-ST1 enveleope (env) protein. MN-ST1 is a Human immunodeficiency virus frype 1 (HIV-1) Strain. The specification also describes the env and rev coding sequences of the HIV-1 strain BA-L (ATCC 40890). BA-L is more typical of United States isolates of HIV-1 than previously known strains. Recombinant, complete env protein of the BA-L strain is used as a vaccine component and for immunotherapy of existing HIV infections, to detect HIV-specific antibodies, e.g. in donated blood, and as an immunogen to raise specific antibodies, for HIV-1 diagnosis. The present sequence represents the predicted amino acid sequence of the MN-PH1 clone envelope (env) protein. MN-PH1 is a Human immunodeficiency virus type 1 (HIV-1) clone. The specification also describes the env and rev coding sequences of the HIV-1 strain BA-L (ATCC 40890). BA-L is more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DNA encoding env protein of the human immune deficiency virus isolate ^{1} . useful for producing protein for use in vaccines, as assay reagent

The clone was designated lambda MN-PH1 The present sequence was deduced from the env gene region of the MN-PH1 genome. (Updated on 25-MAR-2003 to correct PF field.) typical of United States isolates of HIV-1 than previously known strains. Recombinant, complete env protein of the BA-L strain is used as a vaccine component and for immunotherapy of existing HIV infections, to detect HIV specific antibodies, e.g. in donated blood, and as an immunogen to raise specific antibodies, for HIV-1 diagnosis. The invention relates to a method of identifying a human immunodeficiency virus type-1 (HIV-1) envelope protein which produces a cross-reactive immune response following administration in a mammal by: (a) substituting one or more amino acids in or near the gp41, CD4-binding, co-receptorbinding or outer domains of gp120; and (b) identifying one or more amino acid substitutions in the domains that produce a cross-reactive immune response following administration in a mammal. The method is useful for identifying an HIV-1 envelope protein, which produces a cross-reactive immune response following administration in a mammal. Compositions comprising such HIV-1 envelope protein may be used as HIV subunit vaccine or immunogenic composition that can induce antibodies that neutralize HIV strains across different phenotypes and clades, or for the prevention or therapy of HIV-1 infection. This sequence corresponds to the gp120 envelope glycoprotein from a neutralisation antibody-sensitive (T-cell line adapted) MN strain of HIV-1 (MN-P).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         5

This sequence represents the Human Immunodeficiency Virus Type I (HIV-I) isolate MN envelope protein gpl20. This protein is used in a novel method to produce and analyse peptides oligomers, "peptomers", consisting of several peptide monomers arranged head to tail, each monomer comprising a sequence from a CD4-binding region of HIV gpl20. Such peptides are useful as assay reagents for detecting anti-HIV antibodies in biological samples, e.g. blood samples, or as a therapeutic agent for inhibiting infection of T cells by HIV and as an immunogenic agent for inhibiting and thus are consistent in their sequence and structure. Most HIV vaccines and detection peptides used currently rely on fragments of inactivated live viruses and thus may not contain the correct epitopes to elicit an immune response. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            300

```
Peptide analogues of HIV virus antigen contain a plurality of peptide monomers, each comprising the gpl20 CD4 binding region consensus sequence (amino acids 419-436) (see AAR79172). The synthetic peptomers are useful as therapeutic agents, immunogens in vaccine compositions or for the diagnosis of disease. Since the analogues maintain the conformation of the native proteins from which they are derived (the consensus sequence), they are useful against infection by various HIV-1 and HIV-2 isolates (see AAR79174-84)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        GYSPLSLOTRPPVPRGPDRPEGIEEEGGERDRDTSGRLVHGFLAIIWVDLRSLFLFSYHH 771

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is that of an ancestral HIV-1 group M, subtype B gp160 (env gene product) sequence. The invention provides compositions and methods for determining ancestral viral gene sequences and ancestral viral protein sequences for highly diverse viruses, such as HIV-1. The methods use samples of circulating viruses to determine an ancestral case, the ancestral HIV-1 subtype B env sequence (see AAH26468) was determined using 38 subtype B env sequence (see AAH26468) was determined using 38 subtype D (outgroup) sequences. The distances between this ancestral viral sequence and circulating strains used to determine it were on average 12.3% (range: 80-21.0%) while the available specimens were 17.3% different from each other (range: 13.3-23.2%). Thus, the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           circulating virus than to any other variant. The ancestral gp160 sequence included a wide variety of immunogenically active peptides when processed for antigen presentation; nearly all known subtype B CTL epitope consensus amino acids were represented. Thus, an immunogenic composition to this subtype B ancestor protein will elicit broad neutralising antibody against HIV-1 isolates of the same subtype, and will also elicit a broad cellular response mediated by antigen-specific T-cells. A claimed vaccine composition comprises a viral ancestor protein or its immunogenic fragment, especially one derived from the HIV-1 group M subtype B gp160 ancestral protein. (Updated on 11-SBP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Preparing an ancestral viral amino acid sequence useful as a vaccine comprises determining a recent ancestor of a circulating virus by maximum

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAW43066-W43080 are fragments of the gpl20 protein from different human immunodeficiency virus type I (HIV-1) isolates. These proteins are used in a novel method for purifying HIV gpl20 so as to provide a purified gpl20 glycopeptide having protein/protein binding properties substantially identical to natural viral HIV gpl20. The method involves

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The permuted circular unintegrated viral DNA representing the complete HIV-1 (MN) genome was cloned into the EcoRI site of lambda grWES.lambda B DNA from total DNA of H9 cells producing HIV-1 (MN). This clone was designated lambda MN-H1; it was subcloned in M13mpl8 and M13mpl9 and the DNA sequence of the entire clone was obtained the amino acid sequence of the enverte the protein was deduced from it. (Note: Revised entry submitted to correct the patent number format of US Government-owned NTIS applications to prevent clashes with ongoing US granted patent numbers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ð
fractionating a crude gp120 preparation containing full-length, glycosylated gp120 using ion exchange chromatography so as to provide a glycosylated gp120 using ion exchange chromatography so as to provide a selected that exhibits specific binding affinity for CD4 peptide, thereby producing a first fractionated material. The first fractionated material is fractionated by hydrophobic interaction chromatography so as to provide a second collection of fractions from which a second collection is selected that exhibits specific binding affinity for CD4 peptide. This second fraction is fractionated by size exclusion chromatography so as to provide a third collection of fractions exhibiting specific binding affinity for CD4 peptide, thereby providing the purified gp120. The purified gp120 can be used for antibody production and in vaccines. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   709

The specification describes a method of determining the influence of variation in host genes on selection of microorganisms with protein substitutions. The method comprises typing all individuals of a substitutions. The method comprises typing all individuals of a substitutions. The method substitutions at least one selected intrinsic polymorphic marker involved in the host response to the presence of the microorganism. The method is useful for examining selective pressures confronting a wide range of organisms that exhibit pathogenic traits in a host, such as bacteria, fungi, mycobacterium, confronting and protein mycobacterium, confronting and protein mycobacterium, confronting and selective pressures such as HCV and HBV. The method is useful for hepatitis related viruses such as HCV and HBV. The method is useful for designing a vaccine to prevent or delay the emergence of drug resistance in patients treated with a particular drug specific for a microorganism where the drug affects the replication of the microorganism at the conclose protein, which is expected to provide optimal cyclotoxic T lymphocyte (CTL) induced therapeutic protection to the cohort examined in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    9

The invention relates to a method of identifying a human immunodeficiency virus type-1 (HIV-1) envelope protein which produces a cross-reactive immune response following administration in a mammal by: (a) substituting one or more amino acids in or near the gp41, CD4-binding, co-receptorbinding or outer domains of gp120; and (b) identifying one or more amino acids substitutions in the domains that produce a cross-reactive immune response following administration in a mammal. The method is useful for identifying an HIV-1 envelope protein, which produces a cross-reactive immune response following administration in a mammal. Compositions comprising such HIV-1 envelope protein may be used as HIV subunit vaccine or immunogenic composition that can induce antibodies that neutralize HIV strains across different phenotypes and clades, or for the prevention or therapy of HIV-1 infection. This sequence corresponds to the gp120 envelope glycoprotein from a neutralisation antibody-resistant (primary) mustrain of HIV-1 (MN-P).
                                                                                                                                                                                                                                      Identifying an HIV-1 envelope protein that produces a cross-reactive immune response in a mammal, comprises introducing amino acid substitutions into ap120, and identifying substitutions that produce cross-reactive immune response.
                                                                                                                                                                                                                                                                                                                      Disclosure, SEQ ID NO 2; 68pp; English

where the modifications comprise a V35C, Y39C, W44C, P484C, G488C, C759C, C7 W490C, or A492C mutation in gp120 and a D580C, W597C, T596C, C7 W601C mutation in gp11, such mutations being numbered by reference to the gp160 (precursor of gp41 and gp120) HIV-1 isolate JR-FL and the modifications resulting in a disulphide bond between gp120 and the stabilises the otherwise non-covalent gp120-gp41 interaction. The stabilization results in enhanced binding of the disulphide-bonded gp120-gp41 complex to HIV-1 non-neutralising antibodies and reduced binding cf the complex to HIV-1 non-neutralising antibodies and reduced binding cf the complex to HIV-1 non-neutralising antibodies and reduced binding cf the complex to HIV-1 non-neutralising the nucleic acid cited above, a copplicable vector comprising the nucleic acid, a host cell comprising the replicable vector and a composition which comprises the nucleic acid. The modified gp120 is further characterised by the absence of one or more applied and gp10 which has the proteolytic cleavage site between gp120 and gp41 resulting in a 140kDa proteolytic cleavage site between gp120 and gp41 resulting in a 140kDa proteolytic cleavage site between gp120 is further characterised by the absence or prior to ransmembrane domain of gp41 resulting in a 140kDa proteolytic cleavage site between gp120 is further characterised by the absence or prior treating a viral disease, e.g. HIV infection (AIDS).

Credicines for treating a viral disease, e.g. HIV infection of the pilote comprises or enfancing in the severity of a viral disease, org. HIV infection of the control of a subject becoming infected with a virus, the control of the gp120 of a viral disease, org. HIV infection of the dp120 of a viral disease, org. HIV infection of the dp120 of a subject becoming infected with a virus, and the dp120 of a viral disease, org. HIV infection of the dp120 of a virial disease, and the dp120 of a ģ 120 300 405 480 462 522 CSRPNNNTRKSIPMGPGRAFYTTGQIIGDIRQAHCNISKTNWTNALKQVVEKLGEQFNKT 360 9 a subject production of antibodies or cytotoxic T lymphocytes. The present sequence is wild-type HIV gp160 protein.
